- ▶ *Tier 1 network connectivity*
- ▶ *Flexibility for expanded capacity*
- ▶ *Competitive pricing*
- ▶ *Onsite hardware inventory*
- ▶ *Onsite expert Staff*

Your On Demand IT Resource

Successful businesses today must have high-speed connectivity, the flexibility to quickly increase IT capacity, assurance of total security and a reliable IT infrastructure. Meeting these challenges internally can be costly, and worse, can detract from a focus on core business that reduces a company's ability to compete.

Colocation is the hosting solution for companies that own hardware but lack the budget or resources for building the infrastructure that will guarantee power, network availability and a secure environment for their business-critical systems. VeriCenter™ delivers high-speed Internet connectivity, superior facilities and the technical resources to efficiently run and manage your IT infrastructure.

VeriCenter's state-of-the-art data centers, located in Atlanta, Boston, Dallas, Denver and Houston, offer fail-safe hosting and 24x7x365 customer support to keep your operation running around the clock. With VeriCenter's base colocation services, you maintain your hardware and software in an environment that provides connectivity and performance of your systems. Optional services for tape backups, SAN storage, system design, monitoring and reporting can increase your operational flexibility and security.

Why Should You Colocate with VeriCenter?

By partnering with VeriCenter, your organization reaps the opportunities and benefits of optimal IT operation, without the high capital and resource investments required to create a world-class solution in-house. Tailor our colocation services to fit your needs.

Secure, Reliable Facilities

Each of VeriCenter's Class A data centers offer redundant HVAC climate control and UPS, along with fire suppression systems and diesel-generated power backup to protect your equipment and data. Environmental systems are monitored 24x7x365. Physical access is limited to authorized personnel via multiple control levels and to escorted, authorized customers. Our security procedures are backed by our SAS70-Level II certifications. Our colocation services include receiving processes for customer equipment, secure storage and equipment-staging areas. Select the right sized space to suit your needs.

Cabinet Space

Secure cabinets are available in standard full or half sizes, and come with 20-AMP 110v power outlets, with flexible power configurations and optional cross-connections between cabinets.

Cage Space

Private cages are available by the square foot with a variety of variety of management options.

Flexible, Reliable Connectivity and Bandwidth

Redundant Internet connectivity, via Tier 1 backbone network providers delivers, "private transit" peering that avoids the congested public peering points and improves your applications and system performance. Most of our data centers are directly connected to the Sprint® high-speed IP network, or you can select the carrier of your choice. As your business requirements change, VeriCenter offers added bandwidth at fixed and usage-based pricing. Each VeriCenter colocation customer receives a Fast Ethernet Internet connection to the core network infrastructure and a certain number of DNS and IP addresses, based on cabinet size. Additional Ethernet connections for redundancy and additional addresses and URL monitoring services are available.

Service Guarantees

VeriCenter's comprehensive services are backed by a service level agreement (SLA) that provides for 100 percent power and network availability. We regularly and rigorously test the equipment and capabilities of each facility to ensure optimum performance. Additionally, our SLA ensures a solid commitment to facilities management and network performance.

Onsite Technical Services

VeriCenter assists customers with building and maintaining their online solution with an array of on-site technical services. Whether it is a simple backup media rotation or a complex firewall configuration, VeriCenter can assist you.

VeriCenter's Infrastructure and Services Support Your Business

VeriCenter's enterprise hosting and managed services feature leading edge infrastructure, systems and facilities and a dedicated team of experts available around the clock. Our infrastructure and services support your:

- Advanced Websites
- Internal/external business applications
- ASP applications
- Utility computing requirements
- Disaster recovery plans
- Colocation requirements
